- Change in attenuation coef gamma (energy Swin repartition between vegetation and ground) impacts soil humidity.
- if more energy reaches the ground (sim3) less water in the top part of the soil
- Higher Ksat: lower humidity but faster response (easier circulation)

Below, no difference between 2 and 3, only affects the surface
Ksat larger-> faster circulation

Augmentation de la conductivité permet à l'eau de circuler plus profond et au modèle de simuler les pics de teneur en eau

Bilan des obs (! Rescaling à faire pour les stocks obs avec les cailloux!)

P5 référence
avec ksat à
environ 10-6
m/s sur tout

P7 ksat environ 10-6
mais 1ere couche
de sol avec un ksat
+ faible
pour créer un refus
d'infiltration donc
du ruissellement et
tenter de limiter la
percolation et la
perte de stock

FLUX

simulation de référence p3: (ksat de puechabon)

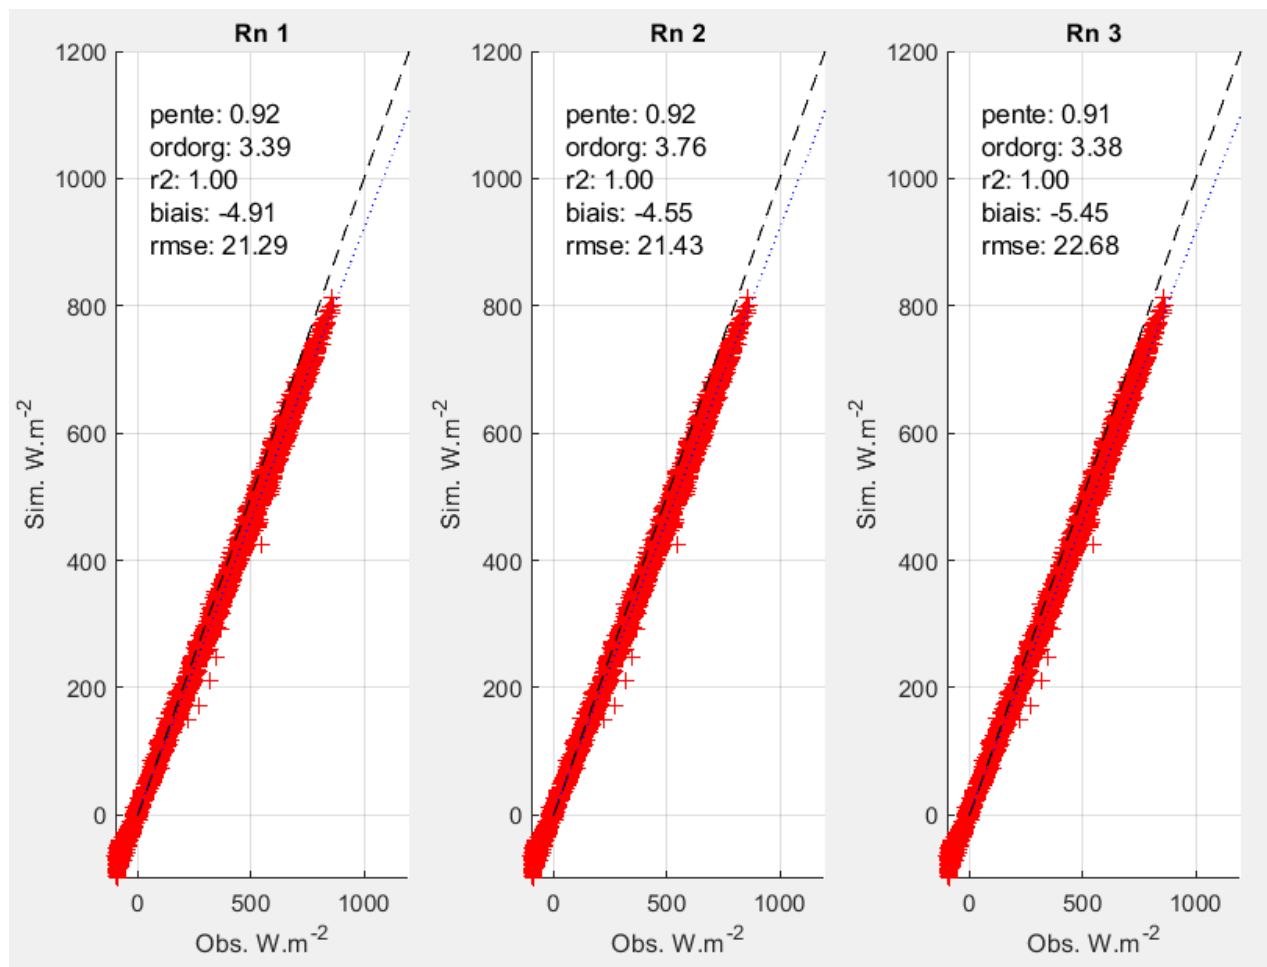

p5: $\text{ksat} * 10$ (10^{-6} m/s)

p7: $\text{ksat} * 10$ et horizon à la surface avec ksat
permettant un refus à l'infiltration

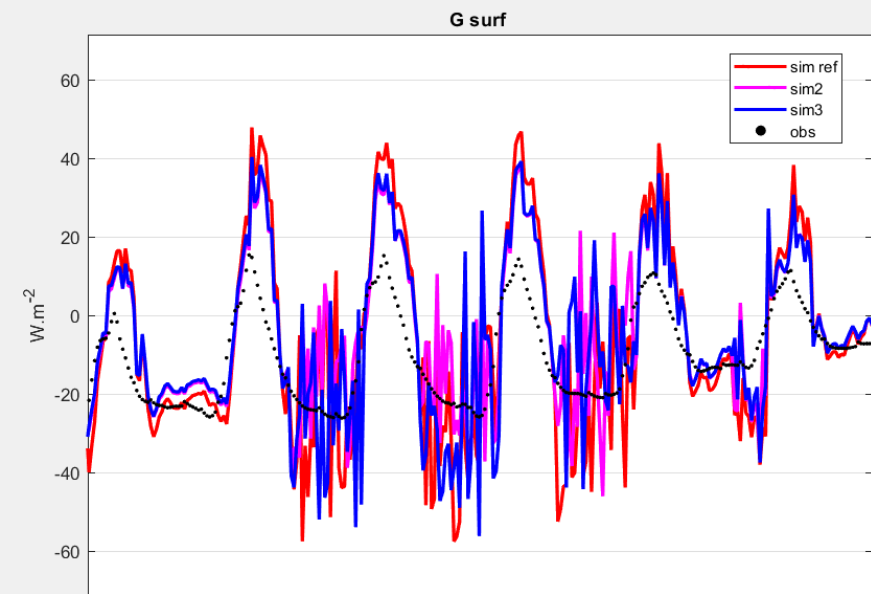

Rayonnement net

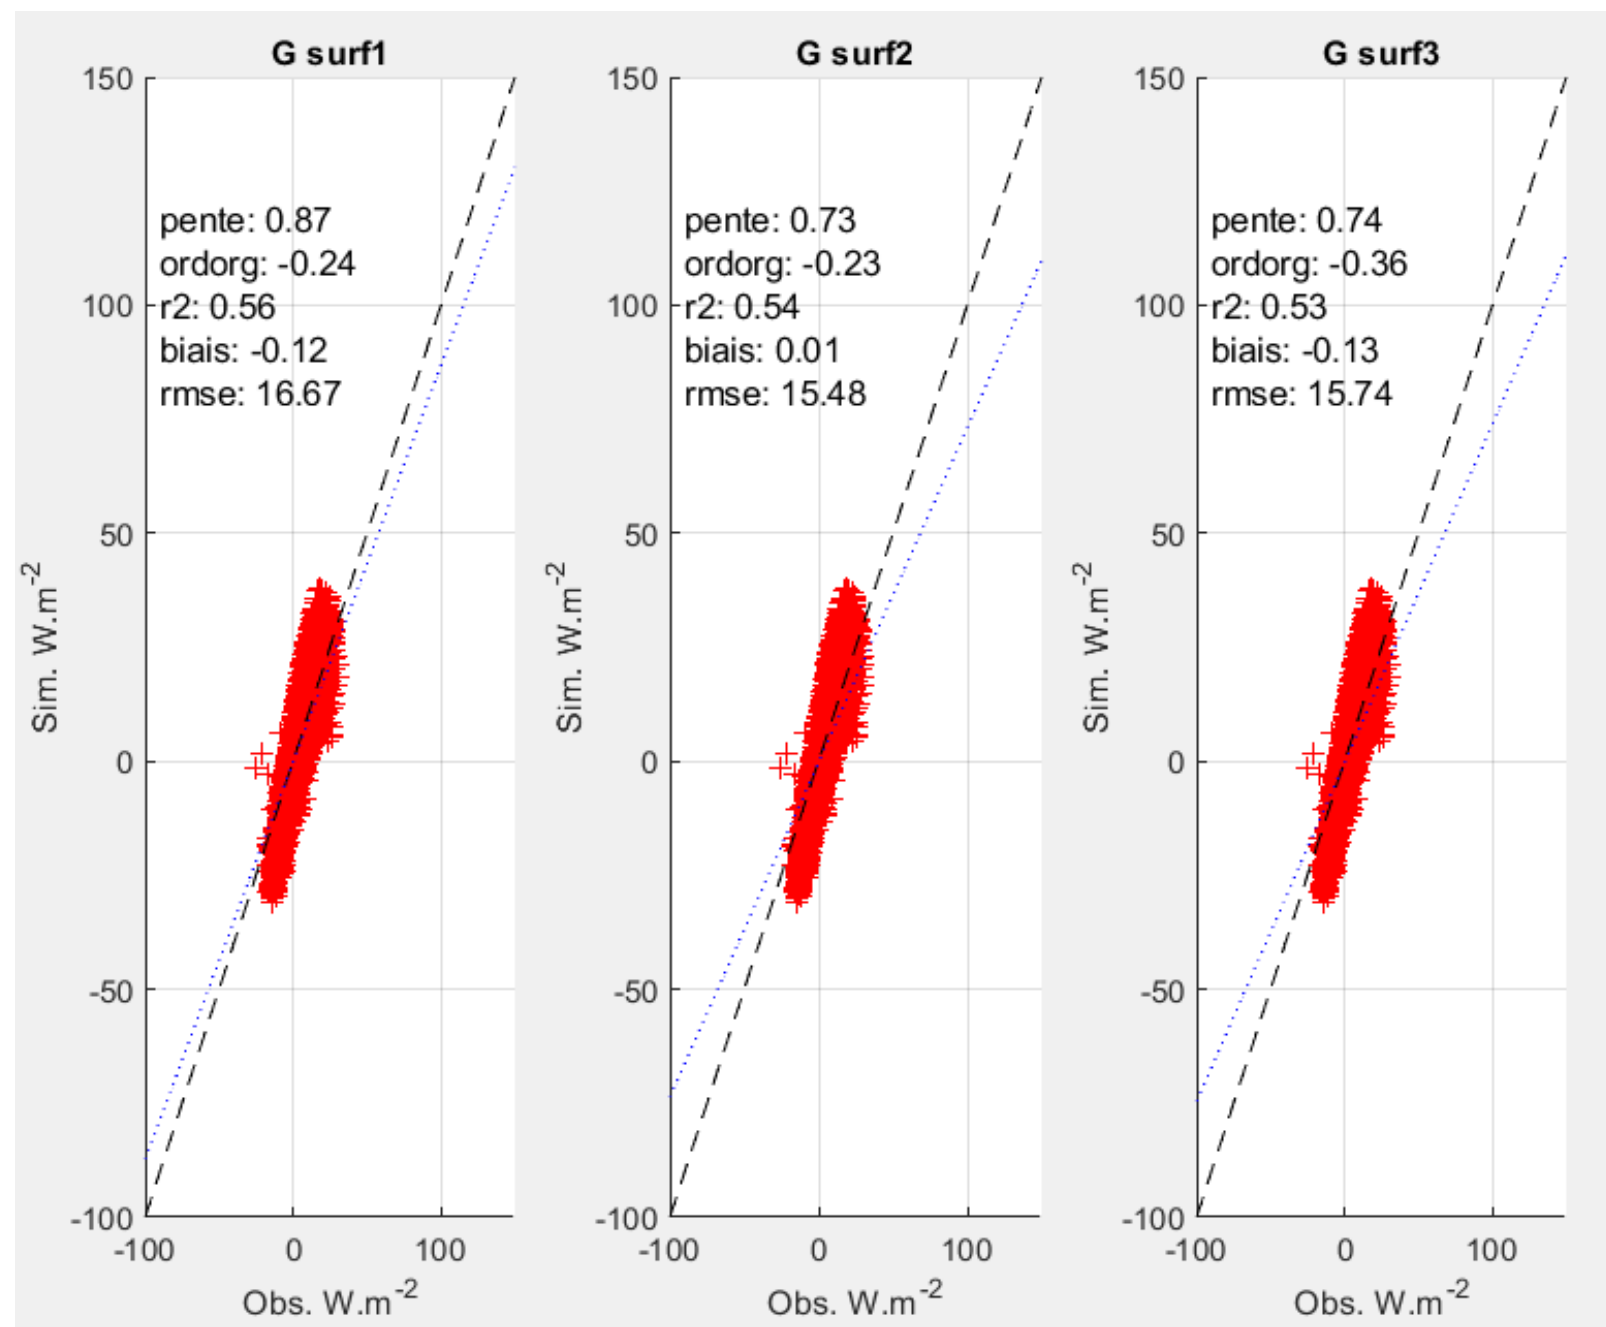

Zoom juin 2020
